

# Wiring Legacy Skyline Lighting With DC Power & Resistor Board

Connect the long cable to the resistor value you want for the brightness of the lamps. This will vary depending on the power supply value you use.

The longer wire from each lamp is the positive connection, connect up the lamps in parallel as shown above. Each resistor board can connect up to 3 separate lamps.

= 1.5K $\Omega$  = Brightest

= 3.0K $\Omega$  = Middle

= 5.6K $\Omega$  = Dimmest

Please note - resistor markings may vary from this diagram but the values are as shown
